Growth Supplement 30: Low Use Rate, Big ROI

As we shift into the growing season for the majority of row crops, there are numerous factors at play that impact the cost of providing nutrients for plants, protecting them from pests and diseases, and overall giving them the best chance at producing high yields. Finding ways to maximize the return of investment for each input is how many farms are going to be successful this year.

When a customer comes to us looking for ways to increase the productivity of other inputs and optimizing ROI, Growth Supplement 30 is one SoilBiotics product we turn to. It's a foliar applied nutrient stabilizer. Containing plant-based fulvic acids, Growth Supplement 30 supports vital plant processes including metabolism and transportation of nutrients. Its formulation makes it a strong chelator, meaning it forms bonds with minerals and nutrients making them easier for the plant to absorb.

Where the attributes of Growth Supplement 30 come in especially handy is in a tank mix with herbicides — even those chemistries we've seen reduced effectiveness in over the years. The recommended AMS, surfactants and water conditioner can be dropped from the mix and replaced with Growth Supplement 30, which improves the ability of herbicide to work on those weeds while performing all the other tasks of the inputs that are normally included in the tank mix.

This drastically reduces costs because the four pounds to an acre of AMS plus surfactant plus water conditioner are all replaced with 10 ounces per acre of Growth Supplement 30. We've had many SoilBiotics customers who have seen great success with this program. Some have been able to take down waterhemp they had almost given up trying to defeat.

If you have questions about Growth Supplement 30, how to use it in this way or how it works, please give our office call.

You can also find trial results from [2025 Growth Supplement 30 trials](#) on our website.

Introducing SB GRO

This year we added the SB GRO line to SoilBiotics' offerings to provide growers with an organic fertilizer lineup to support plant health in both organic and conventional farming practices. There are three different SB GRO products, all OMRI Listed, that can be in-furrow or foliar applied: SB GRO 4-2-2 for early season application, SB GRO 7-0-0 for mid-season application and SB GRO 2-0-6 for mid- to late season application.

We've seen outstanding results with these products in on-farm trials. This information can be found on our website in the trials section. As with any of our products, if you have questions or would like more information, please reach out to us.

The following product promotions are available!

PH K ½ and full ton orders placed in March and shipped by April 20, 2026.

Growth Boost, Organic Growth Boost, and Growth Supplement 30 for orders placed in March and April, that are shipped before May 31, 2026.
